# Covid-19 World Tweet visualization

Visual analytics project

Gabriele Marcozzi, Nicolò Palmiero

#### Introduction

#### Why visualize Covid-19 related Tweets?

- Temporal correlation between Tweets and Covid-19 cases
- Spatial correlation between Tweets and Covid-19 cases

The goal of this project is to find out what relationships exist between the number of tweets related to covid-19 and the spread of the pandemic.

#### Related Work

#### **Visualizing the Covid-19 Twitter chatter dataset**

Similar solutions, objectives and views

- heat map showing the different number of tweets according to the country.
- bar-chart showing the comparison of number of tweets by country in a bar view.

#### Design and analysis of a large-scale COVID-19 tweets dataset

Similar solutions and views

• representing the total number of tweets in a month-by-month representation, according to the country.

#### Related Work

## Topics, Trends, and Sentiments of Tweets About the COVID-19 Pandemic: Temporal Infoveillance Study Similar solutions and objectives

• examines key themes and topics of English-language COVID-19–related tweets posted by individuals and explores the trends and variations of the COVID-19–related tweets.

#### Public risk perception and emotion on Twitter during the Covid-19 pandemic

Similar objectives and views

comparison of the proximity of each country

#### Dataset

The Coronavirus (Covid-19) geo-tagged tweets dataset from IEEE-DataPort contains information from March 2020 to January 2021 about covid-19 related tweets from all over the world.

#### **Preprocessing**

- we decided to shrink the dimensions;
- we decided to drop some columns which contained sparse data;
- we created another column which indicates the ISO 3166 standard id of each country

Moreover, we added two more columns from two different datasets that are *population*, that is the number of people that live in each country, and *cities* that is the number of cities of each country, to have more contextual informations to conduct our analysis.

#### Dataset

At the end of this preprocessing final dataset is composed by 7 columns and 274242 rows. So respecting the AngeliniSantucci index with AS = 1,919,694.

# Visualization Techniques

# Overview

# Number of tweets trend plot

- Shows the trend of number of tweets
- Brushing on the horizontal axis to select the period of interest for all the visualizations
- Tooltip on each point with the exact number of tweets
- Monthly aggregated data

# World Heatmap

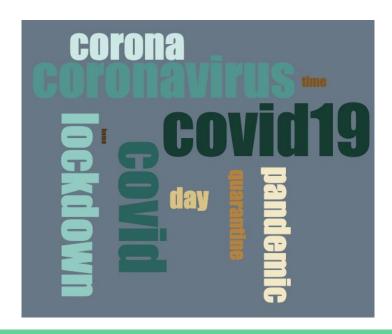

- Number of tweets grouped by nation
- All nations are selectable, bidirectional interaction with MDS and nations trend plot
- Tooltip on each nation to show exact number of tweets
- Color scale shows the approximate number of tweets

### Wordcloud

- Top 10 used words in all tweets
- Bigger font size stands for more frequent word

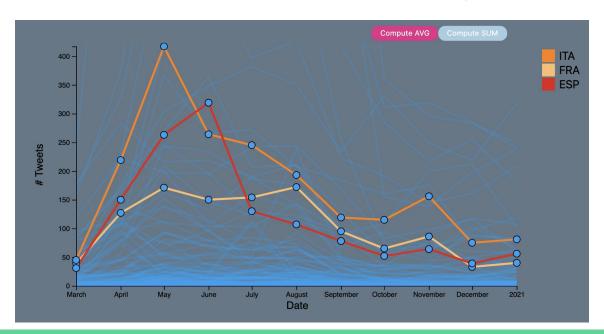

- Color scale that represents the frequency of a word
- Interesting features coming up from the less frequent words of the word cloud

# Nations trend plot

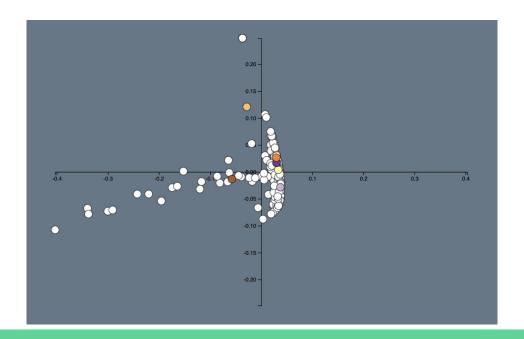

- One trend for each nation
- Selected nations are colored coherently with the other visualizations

- Number of tweets for each month of the selected interval with a tooltip that shows the exact number of tweets
- Compute average and sum of selected nations

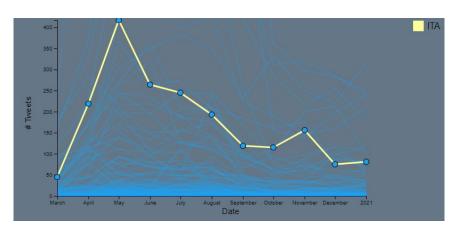

# Multidimensional scaling

- Dimensionality reduction scatterplot
- Each point represents a nation, and points that are near to each other are considered similar
- Bidirectional interaction with the world map and the nations trend plot through nation selection
- Possibility of zooming by brushing

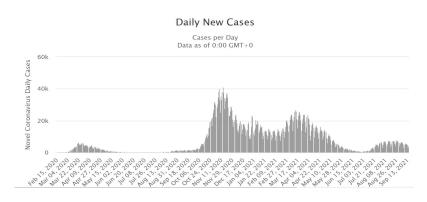

#### Results: Tweets Trend vs Covid new cases Curve

#### Italy

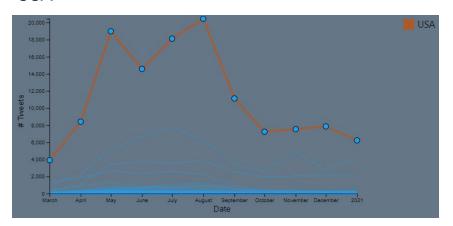

#### Daily New Cases in Italy

#### Future work

- Animated temporal axis chart that when activated, triggers the the other plots and shows sequentially data month by month, in a way in which user can better appreciate all changes.
- Include a dataset composed of tweets published in 2021 or live twitter data streaming.

#### Conclusion

- This tool is useful for showing the spatial and temporal trends of tweets about Covid-19
- Our period of study goes from March 2020 to January 2021
- A potential user is capable of investigating on the number of tweets on any time within our period of study discovering some insights and maybe compare his result with Covid-19 trends of infection
